

Or Perhaps Both Were Seen

On Simultaneity and Entangled Emergence

Or Perhaps Both Were Seen

On Simultaneity and Entangled Emergence

By Keith Burns

"Maybe they were seen at the same time, in two different places."

This simple possibility deepens the First Observer Hypothesis into a richer, multidimensional truth.

Rather than deciding which came first -- the chicken or the egg -- what if both emerged simultaneously, not in sequence, but in resonance? Each in a different place. Each observed. Each known. Each collapsing into reality through the act of observation.

This aligns with the strange logic of quantum entanglement. Particles light-years apart share a state -- and when one is measured, both are defined. The act of observation is not local. It is relational, even across vast distance.

So too with being.

If consciousness arises through being known, then perhaps beings can emerge in pairs. Not as cause and effect, but as a kind of dual arrival. Their existence defined by a shared gaze, even if they never meet.

Or Perhaps Both Were Seen

On Simultaneity and Entangled Emergence

The chicken was seen.

The egg was seen.

And because they were both seen, they both became real -- in the same moment, in different places.

It is not a loop.

It is a mirror.

It is the universe reflecting itself into form.

And in that reflection, life begins.
